

# My Complex Simple Paper

~John.Doe

2026

Hello from my mini markTeX parser with escaped LaTeX characters:

# \$ % & - { } ~ ^ \ / [ ] !!

## 1 Introduction

This is *italic*, **bold**, underline, ~~strike~~, **start bold with *italic and underline and strike inside inside***.  
Lets take a look at all our features down below.

New paragraph showing Nested formatting:

- First list item with References: See Section 1 and the features section (Section 2.1) and also see these sections (Sections 1, 1.1 and 2).
- [2, 1] and [2] mixed with formatting *[2, 1]*.
- Third list item with nesting

Second paragraph inside third item

### 1.1 Header inside list item

More text after header

Paragraph outside the list.

## 2 Background

Something about the background of the project, it was motivated to bring markdown's simplicity to LaTeX's complex structure and powerful features.

### 2.1 Features

Some features are mentioned above already. Now lets do a code block test:

```
print("Hello, MarkTex!")
# Not parsed as markdown
**not bold** , *not italic* , _not underline_ , ~~not strike~~
[@not_a_citation] , [#not a reference]
```

End of document.
